

# Introduction to NumPy

**Bryan Van de Ven**

# What is NumPy

- NumPy is a Python C extension library for array-oriented computing
  - Efficient
  - In-memory
  - Contiguous (or Strided)
  - Homogeneous (but types can be algebraic)

- NumPy is suited to many applications
  - Image processing
  - Signal processing
  - Linear algebra
  - A plethora of others

**NumPy is the foundation of the  
python scientific stack**

# NumPy Ecosystem

scikit-image

scikit-learn

Numba

Scipy

Pandas

Matplotlib

NumPy

# Quick Start

```
In [1]: import numpy as np
```

```
In [2]: a = np.array([1,2,3,4,5,6,7,8,9])
```

```
In [3]: a
```

```
Out[3]: array([1, 2, 3, 4, 5, 6, 7, 8, 9])
```

```
In [4]: b = a.reshape((3,3))
```

```
In [5]: b
```

```
Out[5]:
```

```
array([[1, 2, 3],  
       [4, 5, 6],  
       [7, 8, 9]])
```

```
In [6]: b * 10 + 4
```

```
Out[6]:
```

```
array([[14, 24, 34],  
       [44, 54, 64],  
       [74, 84, 94]])
```

# Array Shape

One dimensional arrays have a 1-tuple for their shape

...Two dimensional arrays have a 2-tuple

...And so on

# Array Element Type (dtype)

- NumPy arrays comprise elements of a single data type
- The type object is accessible through the `.dtype` attribute

Here are a few of the most important attributes of dtype objects

- `dtype.byteorder` — big or little endian
- `dtype.itemsize` — element size of this dtype
- `dtype.name` — a name for this dtype object
- `dtype.type` — type object used to create scalars

There are many others...

## Array dtypes are usually inferred automatically

```
In [16]: a = np.array([1,2,3])
```

```
In [17]: a.dtype
```

```
Out[17]: dtype('int64')
```

```
In [18]: b = np.array([1,2,3,4.567])
```

```
In [19]: b.dtype
```

```
Out[19]: dtype('float64')
```

## But can also be specified explicitly

```
In [20]: a = np.array([1,2,3], dtype=np.float32)
```

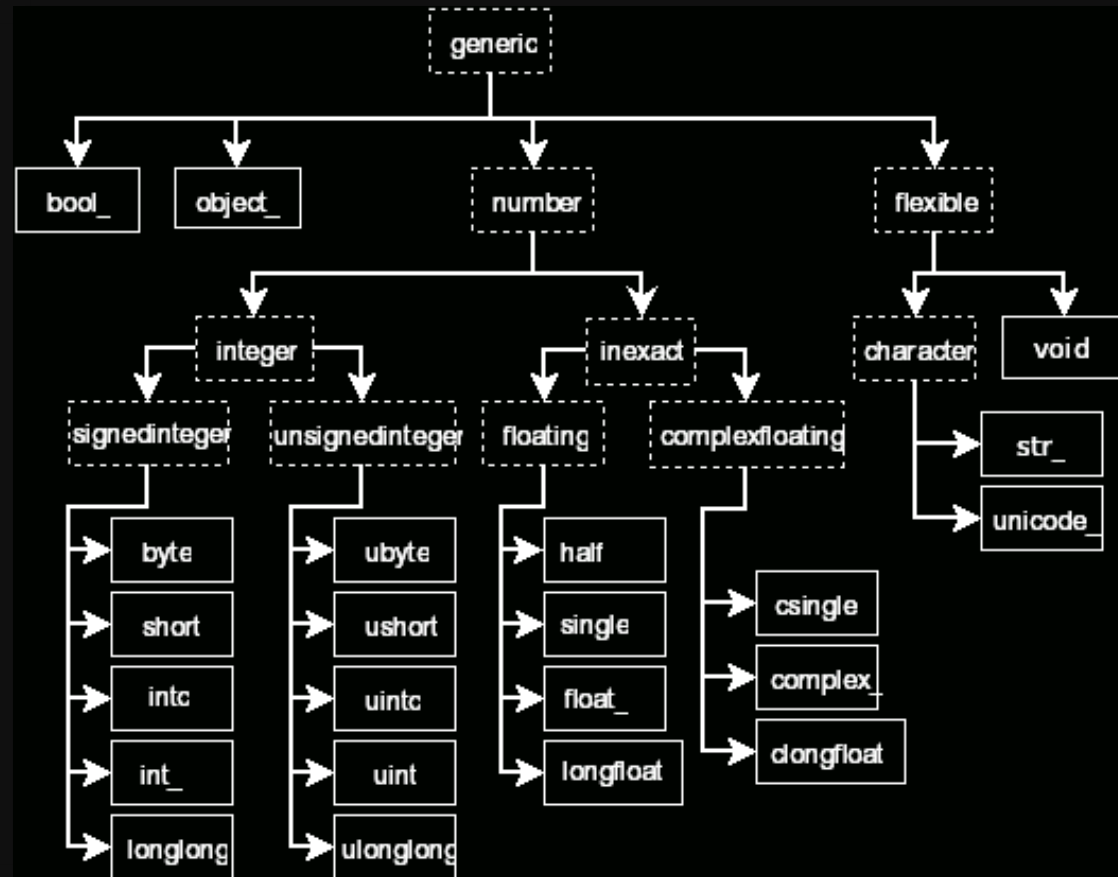

```
In [21]: a.dtype
```

```
Out[21]: dtype('float32')
```

```
In [22]: a
```

```
Out[22]: array([ 1.,  2.,  3.], dtype=float32)
```

# NumPy Builtin dtype Hierarchy

`np.datetime64` is a new addition in NumPy 1.7

# Array Creation

Explicitly from a list of values

```
In [2]: np.array([1,2,3,4])  
Out[2]: array([1, 2, 3, 4])
```

As a range of values

```
In [3]: np.arange(10)  
Out[3]: array([0, 1, 2, 3, 4, 5, 6, 7, 8, 9])
```

By specifying the number of elements

```
In [4]: np.linspace(0, 1, 5)  
Out[4]: array([ 0. ,  0.25,  0.5 ,  0.75,  1.  ])
```

## Zero-initialized

```
In [4]: np.zeros((2,2))  
Out[4]:  
array([[ 0.,  0.],  
       [ 0.,  0.]])
```

## One-initialized

```
In [5]: np.ones((1,5))  
Out[5]: array([[ 1.,  1.,  1.,  1.,  1.]])
```

## Uninitialized

```
In [4]: np.empty((1,3))  
Out[4]: array([[ 2.12716633e-314,  2.12716633e-314,  2.15203762e-314]])
```

## Constant diagonal value

```
In [6]: np.eye(3)
Out[6]:
array([[ 1.,  0.,  0.],
       [ 0.,  1.,  0.],
       [ 0.,  0.,  1.]])
```

## Multiple diagonal values

```
In [7]: np.diag([1,2,3,4])
Out[7]:
array([[1, 0, 0, 0],
       [0, 2, 0, 0],
       [0, 0, 3, 0],
       [0, 0, 0, 4]])
```

# Array Memory Layout

# Indexing and Slicing

0	1	2	3	4
5	6	7	8	9
10	11	12	13	14

all values

`arr[0:2,:]`

`arr[2,1:]`

Implied end

0	1	2	3	4
5	6	7	8	9
10	11	12	13	14

`arr[:2, 2:3]`

Implied zero

NumPy array indices can also take an optional stride

0	1	2	3	4
5	6	7	8	9
10	11	12	13	14

`arr[:, ::2]`

0	1	2	3	4
5	6	7	8	9
10	11	12	13	14

`arr[:, ::2, ::3]`

# Array Views

Simple assignments do not make copies of arrays (same semantics as Python). Slicing operations do not make copies either; they return views on the original array.

```
In [2]: a = np.arange(10)

In [3]: b = a[3:7]

In [4]: b
Out[4]: array([3, 4, 5, 6])

In [5]: b[:] = 0

In [6]: a
Out[6]: array([0, 1, 3, 0, 0, 0, 0, 7, 8, 9])

In [7]: b.flags.owndata
Out[7]: False
```

Array views contain a pointer to the original data, but may have different shape or stride values. Views always have `flags.owndata` equal to `False`.

# Universal Functions (ufuncs)

NumPy ufuncs are functions that operate element-wise on one or more arrays

a    0    1    2    3    4

b    0    10    20    30    40

c    0    11    22    33    44

$$c = a + b$$

ufuncs dispatch to optimized C inner-loops based on array dtype

# NumPy has many built-in ufuncs

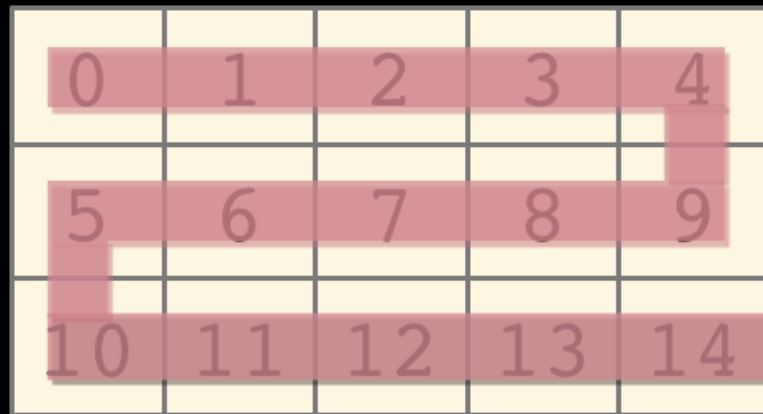

- comparison: `<`, `<=`, `==`, `!=`, `>=`, `>`
- arithmetic: `+`, `-`, `*`, `/`, `reciprocal`, `square`
- exponential: `exp`, `expm1`, `exp2`, `log`, `log10`, `log1p`, `log2`, `power`, `sqrt`
- trigonometric: `sin`, `cos`, `tan`, `asin`, `arccos`, `atan`
- hyperbolic: `sinh`, `cosh`, `tanh`, `asinh`, `acosh`, `atanh`
- bitwise operations: `&`, `|`, `~`, `^`, `left_shift`, `right_shift`
- logical operations: `and`, `logical_xor`, `not`, `or`
- predicates: `isfinite`, `isinf`, `isnan`, `signbit`
- other: `abs`, `ceil`, `floor`, `mod`, `modf`, `round`, `sinc`, `sign`, `trunc`

# Axis

Array method reductions take an optional `axis` parameter that specifies over which axes to reduce

`axis=None` reduces into a single scalar

```
In [7]: a.sum()  
Out[7]: 105
```

0	1	2	3	4
5	6	7	8	9
10	11	12	13	14

`axis=None`

`axis=None` is the default

axis=0 reduces into the zeroth dimension

```
In [8]: a.sum(axis=0)  
Out[8]: array([15, 18, 21, 24,  
27])
```

axis=0 reduces into the first dimension

```
In [9]: a.sum(axis=1)  
Out[9]: array([10, 35, 60])
```

# Broadcasting

A key feature of NumPy is broadcasting, where arrays with different, but compatible shapes can be used as arguments to ufuncs

In this case an array scalar is broadcast to an array with shape (5, )

A slightly more involved broadcasting example in two dimensions

$$c = a + b$$

0	1
2	3
4	5

10	10
20	20
30	30

0	11
22	23
34	35

The diagram shows three 3x2 grids. The first grid, labeled 'a', contains the values 0, 1, 2, 3, 4, 5. The second grid, labeled 'b', contains 10, 10, 20, 20, 30, 30, with the second column shaded gray. The third grid, labeled 'c', contains 0, 11, 22, 23, 34, 35. A plus sign is between 'a' and 'b', and an equals sign is between 'b' and 'c'.

Here an array of shape  $(3, 1)$  is broadcast to an array with shape  $(3, 2)$

# Broadcasting Rules

In order for an operation to broadcast, the size of all the trailing dimensions for both arrays must either:

be **equal** OR be **one**

A	(1d array):	3
B	(2d array):	2 x 3
Result	(2d array):	2 x 3

A	(2d array):	6 x 1
B	(3d array):	1 x 6 x 4
Result	(3d array):	1 x 6 x 4

A	(4d array):	3 x 1 x 6 x 1
B	(3d array):	2 x 1 x 4
Result	(4d array):	3 x 2 x 6 x 4

# Square Peg in a Round Hole

If the dimensions do not match up, `np.newaxis` may be useful

```
In [16]: a = np.arange(6).reshape((2, 3))
```

```
In [17]: b = np.array([10, 100])
```

```
In [18]: a * b
```

```
-----  
ValueError                                Traceback (most recent call last)  
  in ()  
----> 1 a * b
```

```
ValueError: operands could not be broadcast together with shapes (2,3) (2)
```

```
In [19]: b[:,np.newaxis].shape
```

```
Out[19]: (2, 1)
```

```
In [20]: a * b[:,np.newaxis]
```

```
Out[20]:  
array([[ 0, 10, 20],  
       [300, 400, 500]])
```

# Array Methods

- Predicates
  - `a.any()`, `a.all()`
- Reductions
  - `a.mean()`, `a.argmin()`, `a.argmax()`, `a.trace()`,  
`a.cumsum()`, `a.cumprod()`
- Manipulation
  - `a.argsort()`, `a.transpose()`, `a.reshape(...)`,  
`a.ravel()`, `a.fill(...)`, `a.clip(...)`
- Complex Numbers
  - `a.real`, `a.imag`, `a.conj()`

# Fancy Indexing

NumPy arrays may be used to index into other arrays

```
In [2]: a = np.arange(15).reshape((3,5))
```

```
In [3]: a
```

```
Out[3]:
```

```
array([[ 0,  1,  2,  3,  4],  
       [ 5,  6,  7,  8,  9],  
       [10, 11, 12, 13, 14]])
```

```
In [4]: i = np.array([[0,1], [1, 2]])
```

```
In [5]: j = np.array([[2, 1], [4, 4]])
```

```
In [6]: a[i,j]
```

```
Out[6]:
```

```
array([[ 2,  6],  
       [ 9, 14]])
```

## Boolean arrays can also be used as indices into other arrays

```
In [2]: a = np.arange(15).reshape((3,5))
```

```
In [3]: a
```

```
Out[3]:
```

```
array([[ 0,  1,  2,  3,  4],  
       [ 5,  6,  7,  8,  9],  
       [10, 11, 12, 13, 14]])
```

```
In [4]: b = (a % 3 == 0)
```

```
In [5]: b
```

```
Out[5]:
```

```
array([[ True, False, False,  True, False],  
       [False,  True, False, False,  True],  
       [False, False,  True, False, False]], dtype=bool)
```

```
In [6]: a[b]
```

```
Out[6]: array([ 0,  3,  6,  9, 12])
```

# NumPy Functions

- Data I/O
  - `fromfile`, `genfromtxt`, `load`, `loadtxt`, `save`, `savetxt`
- Mesh Creation
  - `mgrid`, `meshgrid`, `ogrid`
- Manipulation
  - `einsum`, `hstack`, `take`, `vstack`

# Array Subclasses

- `numpy.ma` — Masked arrays
- `numpy.matrix` — Matrix operators
- `numpy.memmap` — Memory-mapped arrays

  - `beta`, `gamma`, `geometric`, `hypergeometric`, `lognormal`, `normal`, `poisson`, `uniform`, `weibull`

# Examples

# FFT

```
import numpy as np
t = np.linspace(0,120,4000)
PI = np.pi
signal = 12*np.sin(3 * 2*PI*t)      # 3 Hz
signal += 6*np.sin(8 * 2*PI*t)      # 8 Hz
signal += 1.5*np.random.random(len(t)) # noise
FFT = abs(np.fft.fft(signal))
freqs = np.fft.fftfreq(signal.size, t[1]-t[0])
```
